AYUSH KUMAR

DevOps Engineer

Ghaziabad, UP, India | +91 62026 20905 | kumarayush088@gmail.com | linkedin.com/in/ayush088 | github.com/Ayush8873

SUMMARY

DevOps Engineer at SegueIT, deploying and running client and in-house applications on AWS, Azure and Linux hosting. I build CI/CD pipelines with GitHub Actions and AWS Amplify, ship Docker images through Amazon ECR and Azure Container Registry, manage NGINX as the entry point for production services, and look after monitoring with Prometheus, Grafana, Loki and Uptime Kuma. Comfortable on Linux and cPanel servers, careful with IAM and secrets, and I document everything I set up and change.

TECHNICAL SKILLS

AWS	AWS Organizations (OUs, multi-account), EC2, ECR, Lightsail, Amplify, CloudFront, CloudWatch, IAM (instance roles, least privilege), RDS PostgreSQL, S3, Elastic IP, AWS Backup, security groups
AWS CI/CD	GitHub Actions (hosted and self-hosted runners, deployment environments), AWS Amplify CI/CD, GitLab CI/CD and GitLab Runner, Jenkins (Jenkinsfile, controller/agents), Git
Azure	Virtual Machines, Microsoft Entra ID (Azure AD), Azure Container Registry (ACR), App Service, Storage Accounts, Virtual Networks and NSGs, Resource Groups, RBAC, Azure Monitor
Containers & Releases	Docker, Docker Compose, image versioning, health checks, restart policies, blue/green, rollback, smoke tests, deployment locking
Web & Networking	NGINX (reverse proxy, TLS termination, rate limiting, WebSockets, gzip, caching), DNS, SSL/TLS, TCP/IP, VPN, load-balancing fundamentals
Monitoring & Logging	Prometheus, Grafana, Loki, Promtail, Alertmanager, Node Exporter, cAdvisor, Uptime Kuma, CloudWatch, NGINX access/error logs
Hosting & Systems	Ubuntu Linux, PM2, cPanel, dedicated and shared Linux hosting, Moodle, system hardening, backups, Windows
Identity & Security	IAM and access control, zero-trust concepts, SSO, OIDC, OAuth 2.0, SAML, Authentik, Zoho Directory, secrets management
AI Tools	Claude (Claude Code, Cowork, connectors, skills), Google Antigravity, ChatGPT
App Stack (deploy side)	Next.js, NestJS, Node.js, pnpm / Turborepo monorepos, Prisma, PostgreSQL

EXPERIENCE

SegueIT | Ghaziabad, UP

DevOps Engineer L2 Promoted — August 2026 – Present

Junior DevOps Engineer — January 2026 – August 2026

- Handle build, release and day-to-day operations for client and in-house applications across AWS (EC2, Lightsail, Amplify), Azure and cPanel-managed Linux servers, with separate test and production environments.
- Built the GitHub Actions → Amazon ECR → EC2 release flow for a pnpm/Turborepo monorepo, producing separate API and web images tagged with the Git commit SHA so every release can be traced back to its source.
- Manage client AWS accounts in AWS Organizations, one OU per client to keep access, resources and billing separate.
- Removed long-lived AWS access keys from servers by giving EC2 an IAM instance role limited to pulling from the required ECR repositories; use Azure Container Registry for Azure-hosted services.
- Run production deployments through a self-hosted GitHub Actions runner with a deployment lock, so two releases can never overlap on the same server.
- Configure and maintain NGINX for production traffic: TLS 1.2/1.3, HTTPS redirects, rate limiting (10 req/s with burst), security headers, blocking of sensitive paths, WebSocket upgrades, gzip and static caching.
- Work with metrics, logs and uptime checks (Prometheus, cAdvisor, Promtail, Loki, Uptime Kuma) and use Grafana, CloudWatch and container logs to narrow down whether an issue sits in the host, the container or the application.
- Keep test and production apart: separate database endpoints and credentials, GitHub deployment environments, environment-specific secrets and restrictive security groups.
- Handle system administration: Linux and Windows servers, user access, updates, backups and troubleshooting.
- Contribute to security and access-control documentation, including IAM practices and zero-trust implementation planning.

TECH-A-INTERN | *AWS Cloud Development Intern* | Remote — January 2025 – February 2025

- Provisioned EC2 instances and IAM users and policies for a cloud-hosted application; deployed a WordPress site on AWS with an Elastic IP for a stable public address.
- Containerised application components with Docker to keep development and staging consistent; kept the repository on GitHub and documented the setup and deployment steps.

Agumentik Software Pvt. Ltd. | *Technical Business Development* | Remote — January 2024 – May 2024

- Generated leads, gathered client requirements, prepared proposals and presentations, and relayed client feedback to internal teams.

PROJECTS

Pharmacy E-commerce Platform on AWS GitHub Actions, Docker, ECR, EC2, NGINX, RDS, S3, CloudFront, CloudWatch

- Pipeline stages: lint and test, monorepo build, Docker build for the Next.js storefront and NestJS API, push to ECR, then pull and restart on EC2 behind NGINX.
- Deployment script checks the API and frontend `/health` endpoints and runs smoke tests instead of relying on Docker's container status alone.
- Designed a blue/green release: start the new version on the idle stack, verify health, switch NGINX upstream, and keep the previous stack for rollback (rollout in progress).
- Managed RDS connectivity, Prisma migrations, S3 file storage with CloudFront delivery, environment-specific configuration, container restart policies and NGINX config checks before reloads.
- Used CloudWatch metrics and logs to monitor the EC2 and RDS resources behind the store.

Segue Visitor & Staff Management System: Operations and Monitoring EC2, Docker, NGINX, Prometheus, Grafana, Loki

- Supported a Dockerized backend behind NGINX serving `/v1/` REST APIs and Socket.IO connections, with connection-upgrade headers and proxy timeouts set for long-lived WebSockets.
- Worked on the monitoring stack: Prometheus and Node Exporter for host metrics, cAdvisor for containers, Promtail and Loki for logs, Grafana dashboards and Alertmanager; drafted alerts for target down, high CPU, low disk, memory and container restarts.
- Production workflow: validate and build, take the deployment lock, deploy, verify container state and health, then release the lock and report the result.

Segue Monitor: White-labelled Uptime Kuma on Azure Azure, ACR, Docker, GitHub Actions, Uptime Kuma

- Deployed Uptime Kuma on Azure through a GitHub Actions pipeline and rebranded it as Segue Monitor for uptime checks.

Transcriber Azure, ACR, Docker, GitHub Actions

- Containerised the Transcriber application and deployed it on Azure through a GitHub Actions pipeline, with images in ACR.

Qlik-to-Fabric Azure, ACR, Docker, GitHub Actions

- Deployed the Qlik-to-Fabric application on Azure through a GitHub Actions pipeline, with images in ACR.

Project Management System Azure, ACR, Docker, GitHub Actions

- Deployed the Project Management System on Azure through a GitHub Actions pipeline, with images in ACR.

SegueIT Company Website AWS Lightsail, GitHub Actions, CI/CD

- Deployed the SegueIT company website on AWS Lightsail with a GitHub Actions pipeline that deploys on every push.

Home Loan Advisory Website AWS Amplify, CI/CD

- Deployed an Australian home loan advisory website on AWS Amplify with branch-based CI/CD builds and a custom domain.

Education Client Hosting cPanel, Moodle, dedicated and shared Linux servers

- Manage the client's servers through cPanel: deployed and maintain the open-source Moodle LMS on a dedicated server, and host the client website on a Linux enterprise shared-hosting server.

Makhana E-commerce Website on AWS Ubuntu, Next.js, NestJS, Prisma, pnpm, PM2, NGINX, DNS

- Deployed the full-stack app on Ubuntu EC2 behind NGINX (proxy to `127.0.0.1:3000`) with TLS, Git-based updates and PM2; pointed the client domain at the instance and debugged DNS and NGINX virtual hosts.
- Traced a frontend build failure to backend Prisma config pulled in through a shared workspace reference.

AWS Security and Backup Operations IAM, AWS Backup, RDS, EBS snapshots, security groups

- Configured automated RDS backups with 7-day retention and EC2 snapshots for server recovery.
- Reviewed IAM policies to remove unnecessary permissions and kept credentials out of source code and Docker images; planned an AWS Backup policy (daily at 02:00 Sydney time, 14-day retention) with restore permissions and a restore-test procedure.

Identity and Access Management: Research and POCs Authentik, Zoho Directory, Docker Compose, OIDC, SAML

- Implemented an Authentik POC locally with Docker Compose and PostgreSQL to evaluate SSO for internal tools, covering users, groups, access policies and OIDC/SAML; checked whether Supabase or Neon could back the deployment.
- Built a Zoho Directory POC to evaluate centralised user management and SSO for company applications.

GitLab CI/CD Proof of Concept GitLab CE, GitLab Runner, Docker

- Installed GitLab CE and a self-hosted GitLab Runner on EC2; built a build → test → deploy pipeline that builds a Docker image, checks HTTP status and page content, then deploys an NGINX container.
- Defined stages in .gitlab-ci.yml, served the site with NGINX, and documented the architecture, deployment flow and limitations.

EDUCATION

B.Tech, Computer Science and Engineering, Lovely Professional University, Punjab 2019 – 2023

EXTRA-CURRICULAR ACTIVITIES

- Volunteered technical support for non-profits and college events; attended the AWS AWSome Day online conference.
- Completed AWS and Linux courses (Udemy, Great Learning), AWS Educate: AWS Management Console, DevOps Bridge Course and introductory AI training; earned a certificate from the GUVI–HCL DevOps fundamentals webinar.
